## Apache xampp windows 10

I'm using XAMPP, and I can start Apache, but, start MySQL (phpMyAdmin)! When I start, I get this error; 10:07:49 [Apache] Error: Apache off unexpectedly. 10:07:49 [Apache] This could be due to a blocked port, missing dependency, 10:07:49 [Apache] improper privilege, an accident, or another stop by method. 10:07:49 [Apache] Press the log button to view the error log and check Windows Event Viewer for more clues 10:07:49 [Apache] If you need more help, copy and post the entire log window on this 10:07:49 [Apache] forums I search on it, and, change apache's port in Config-&gt; service and port settings. I have; Service Name: Apache 2.4 Main Port: 122 SSL Port: 444 I Skype (Windows 8/10/10) Nothing is working. I have in the httpd.conf file; Listen 122 servername localhost: 122 I start and receive it through apache\_start.bat; (OS 10013) was an attempt to use a socket prohibited by its access permissions in a way. : AH00072:make\_sock: Cannot force to know [:]: 445 (OS 10013) was an attempt to use a socket prohibited by its access permissions in a way. : AH00072: could not force address to make\_sock:0.0.0.0:445 AH00451: No listening sockets are available, closing AH00015: Unable to open log Please note that not all log files exist! Skype is uninstalled. XAMPP is a free open source software that provides web designers and developers with an easy way to install components to run PHP-based software such as WordPress, Drupal, Joomla, and others on Windows 10, Linux and MacOS. If you're a web developer, or trying to get involved in a blogging, XAMPP will save time and frustration to manually install and configure Apache, MySQL, PHP and Perl on your computer to create a test environment. In this guide, you will learn the steps to install XAMPP on Windows 10 as well as instructions on configuring the web environment and fixing common problems after setup. To download and install XAMPP on Windows 10, use these steps: Open the Apache Friends website. Click the Download button for the Windows version of XAMPP and save the file to your computer. Quick note: If you have special version requirements for PHP, download the version you need to install. If you don't need the version, download the oldest version, as it can help you avoid issues trying to install PHP based software. In addition, these instructions have been tested to work for XAMPP version 7.3.22 and earlier versions, but you can also use them to install later versions. Double-click the downloaded file to launch the installer. Click the OK button. Click the Next button. The complete XAMPP installation on Windows 10 XAMPP offers a variety of components that you can install, such as phpMyAdmin, PHP, Apache, and much more. For the most part, you'll use most of these components, such as it's recommended to exclude default options. Click the Next button. Use xampp installed component default Location. (or choose another folder to install the software in the Choose Folder field.) Click the Next button. Select the language for the XAMPP installation location XAMPP Control Panel. Click the next button. Learn more about Bitnami for the XAMPP option. Click the Next button. Click on the next button again. The XAMPP installation wizard on Windows 10 Click allow the access button to allow the app via Windows Firewall (if applicable). Click the Finish button. Once you've completed the steps, XAMPP Control Panel will launch, and you can start web server environment configuration. The XAMPP Control Panel includes three main sections of how to configure XAMPP on Windows 10. In the Modules section, you will find all web services available. You can start each service by clicking the Start button. When you start some services, including Apache and MySQL on the right, you'll also see process ID (PID) numbers and TCP/IP port (port) numbers that each service is using. For example, by default Apache uses TCP/IP ports 80 and 443, while MySQL uses TCP/IP port 3306. You can also click the Admin button to get access to the administration dashboard for each service and verify that everything is working correctly. The XAMPP control panel on the right, is a list of buttons to configure the different aspects of the control panel, including the config button, which modules will start automatically when launching XAPP. The Configuring NetStart button will give you a list of services currently accessing the network, including TCP/IP address and port, and process ID information. Netstatn addition, from the control panel, shell command-line utility. XAMPP installation folder, quick access button to open services and close the app. Finally, you get the log section, where you can get a look at what happens every time the module starts or changes the settings. It's also the first place to see when something isn't working. XAMPP Control Panel LogsThe default settings should work for most people using XAMPP to create a test environment to run the website. However, depending on your setup configuration, you may need to set a password for the TCP/IP port number, database upload size, or phpMyAdmin. To changing these settings for apache server, you need to use the config button for the corresponding service. For example, you need to open the httpd.conf file to change the settings on the Apache server, and my.ini file to change mySQL settings. How to fix Apache XAMPPThe XAMPP installation not started on is very straightforward, but Windows 10 can sometimes not allow Apache server to run. Typically, this is because the World Wide Publishing Service is running on port 80 on your computer, which is also the default TCP/IP port that Apaches uses on XAMPP, and two applications cannot use the same networking port. If you run into this issue, all around There are some ways to go. You you Uninstall the publishing service, or you can change the default port on Apache. Uninstall World Wide Web Services If you don't have an app based on the World Wide Web Services feature, you can uninstall it using these steps: Open Start. Search for Control Panel, and click on the top result to open the experience. Click Programs. Click on the program and features options. Click on turn Windows features or off options from the left pane. Turn on or off extend Windows features Internet Information Services branch Clean Up World Wide Web Services option. Click the OK button. Microsoft IIS - World Wide Web Services resume your computer. Start the XAMPP Control Panel. Click the Start button on Apache. After completing the move, Apache must be able to run in port 80 on your device. Change default Apache TCP/IP Porterlive Instead of deleting World Wide Web Services, you can configure Apache to run on a different TCP/IP port. To change apache listening port on XAMPP, use the steps: Open XAMPP Control Panel. On Apache, click the config button. Select the Apache (httpd.conf) option. Scroll down and find the line: 80. Change the 80 number to another TCP/IP port number that is not in use. For example, you can try port 81. (The line after the change should read: Listen 81.) httpd.conf changes tcp/ip port numbers and stop the httpd.conf file. Click the Start button on Apache from the XAMPP Control Panel. Once you complete the move, the Apache server should run without problems on the new TCP/IP port you specified. The only caveat with this configuration is that you have to attach the TCP/IP port number to the address every time you want to connect to your website. For example, to use apache servers on web browsers, you'll need to type: LocalHost/Dashboard instead of LocalHost/Dashboard. Manually turn off The World Wide Web Publishing ServiceAnother way to stop the service to fix the issue of the port issue and to change its settings only to start the service manually. To change the World Wide Web Publishing Service, use these steps: Open Start. Search for Services, and click Top Results to open the experience. Double-click on the World Wide Web Publishing Service. World Wide Web Publishing Service Click the Stop button. Change the startup type to the Manual. Click apply button. Click the OK button. Open the World Wide Web Publishing Service Settings XAMPP Control Panel. Click the Start button to run the Apache server. The best way to rework Apache is by uninstalling the World Wide Web Publishing Service, but when it's not possible you can optionally change the TCP/IP port number or stop the required service. Another common problem with XAMPP on how to increase phpMyAdmin upload size is the default database upload limit. For example, sometimes developers have a for troubleshooting purposes will make a copy of or work on the site without disrupting the live website. However, people using WordPress or any other content The software will quickly detect that they cannot upload the database because it exceeds the maximum upload size allowed, which by default is 2048 KIB. To increase the database upload limit on phpMyAdmin, use these steps: Open XAMPP Control Panel. Click on the Explorer button. Open the PHP folder. Open PHP ini file with any text editor. Change the value for upload\_max\_filesize and post\_max\_size for the size you want. For example: post\_max\_size = 100M and upload\_max\_filesize = 100M to import database files of up to 40MB. Upload stop buttons for MySQL and Apache to increase phpMyAdmin. Apache and MySQL Once you click the Start button to complete the steps, now you should be able to import large database files on phpMyAdmin. How to change phpMyAdmin password on XAMPPBy default, phpMyAdmin (MySQL) uses root as a username without a password, which means that if you're installing a WordPress site, when asked if you only need to enter root as username and leave the password fee area blank. To change phpMyAdmin password on XAMPP, use these steps: Open XAMPP Control Panel. On MySQL, click the admin button. Click on the User Accounts tab. Click the Edit Privileges link for the user name root, but the hostname is localhost. Click MySQL Edit Root Settings change password button. Confirm a new password. Click the Change MySQL root password go button. After you've completed the step, if you try to login to phpMyAdmin, you can get a message denied access: Can't connect: Invalid settings. Fix using phpMyAdmin in the rare case in the reject message that you are having problems signing in phpMyAdmin, you will need to configure the config.inc.php. To changing the configuration settings in the config.inc.php file, use these steps: the Open XAMPP Control Panel. Click the Explorer button. Open the phpMyAdmin folder. Open config.php file with any text editor. Under authentication type and information, and update the following lines: \$cfg['server'][\$i]['auth\_type'] = 'config'; Replacing config for cookies. \$cfg['server'][\$i]['PermissionNoPassword'] = true; Replacing the truth for false. Config.inc.php authentication type and close the infoSave and file. Once you've completed the steps, you should be able to login to the phpMyAdmin dashboard. Now XAMPP is configured and ready to use with any supported PHP-based software. Update September 22, 2020: This guide was originally published in March 2016, and the information still works with the latest version of XAMPP to ensure it was modified in September 2020. XAMPP.
